Side Quest 6

Project/Assignment Decisions(2-4 Sentences)

For this side quest, I created a small tile-based platformer using p5.js and p5.play. I decided to replace the default character with a fox sprite sheet and added collectibles, enemies, and sound effects to create a more interactive experience. I also integrated background music and step sounds to make the environment feel more immersive. The final design focuses on simple gameplay mechanics such as movement, jumping, attacking, and item collection.

Purpose of Use:

ChatGPT was used to help troubleshoot JavaScript errors, organize the structure of the game code, and integrate sound effects such as background music, footsteps, attack sounds, and collectible sounds. It was also used to help generate supporting documentation such as the README and reflections.

Prompts Used:

Examples of prompts used during development include:

- "How can I add sound effects like footsteps and attack sounds in a p5.js platformer?"
- "How do I implement background music looping in p5.sound?"
- "How can I detect collisions between a player and collectible items in p5.play?"
- "How should I structure a README for a small p5.js game project?"

Summary of Interactions:

ChatGPT provided suggestions for implementing sound effects, improving the structure of the player movement logic, and organizing functions such as

collectible detection and enemy interactions. It also helped generate documentation text for the README and process documentation.

Human Decision Points:

All major design decisions were made by me, including selecting the fox sprite assets, deciding the layout of the tile map, placing collectibles and enemies, and adjusting gameplay mechanics such as movement speed and attack behavior. I reviewed the generated suggestions and modified the code to ensure it worked correctly within my project.

Integrity & Verification Note:

All AI-generated suggestions were reviewed, tested, and modified before being integrated into the final project. The final implementation reflects my own understanding of the code and how the game systems function.

Scope of GenAI Use:

GenAI was used primarily as a **support tool for debugging, coding guidance, and documentation writing**. The final project design, gameplay structure, and asset integration were completed and verified by the author.
